(54) Title: PORTABLE SALES PRESENTATION SYSTEM WITH SELECTIVE SCRIPTED SELLER PROMPTS**(57) Abstract**

A handheld computer unit for use by, e.g., a car sales person (seller) prompts the seller with a standard script to be followed at each step in the process after a prospect enters a dealership. The prospect's response to the scripted questions is used to identify the prospect's particular interests of a general nature, e.g., safety, and of a specific nature, e.g., trailer towing capacity. When either a general or specific interest is identified, the seller is prompted to tailor the conversation to address the prospect's interests. Among other things, the handheld unit can perform functions such as (i) permitting the seller to retrieve useful information such as inventory availability from a sales information data store; (ii) displaying option-sensitive prompts to aid the seller in discussing specific vehicles under consideration; (iii) accessing remote communications links to external data sources to obtain information on credit-worthiness of the prospect, financing terms, and availability; (iv) displaying motivational information such as the percentage likelihood of consummating the sale successfully; (v) providing a communications link with management personnel.

PORTABLE SALES PRESENTATION SYSTEM
WITH SELECTIVE SCRIPTED SELLER PROMPTS

1. BACKGROUND OF THE INVENTION

1.1 Cross-Reference to Related Application

5 This application is a continuation in part of co-pending "parent" application Serial No. 08/587,276, filed January 18, 1996, which is incorporated by reference in its entirety.

1.2 Source Code Appendix

10 The microfiche appendix filed herewith contains computer-program source code and database information for an illustrative implementation of the invention. The source code is copyrighted and is the property of the assignee of this application. Authorization is granted to make copies of the source code in conjunction with making facsimiles of this application and any patent(s) issuing thereon, but all other rights are reserved.

15 **1.3 Introduction**

 The cost of any goods or services that are sold include costs of marketing. Every item (tangible or intangible) that is sold has included in its costs, the costs of "selling" it. Millions of people are employed in "selling" and hundreds of millions of man-hours are expended in direct face-to-face "selling" every year in the United States. The cost of "selling" is every bit as real a
20 part of the cost of an item or service as is the direct labor cost involved in manufacturing the item or providing the service.

 It is generally estimated that less than 10 percent of a salesperson's total time is spent actually "selling" — i.e. the direct face-to-face contact with a prospective buyer. Therefore the efficiency of the face-to-face sales process is directly related to the quality with which the face-
25 to-face contact is carried out.

 The present invention relates to a computer system that addresses some common information-flow problems in a large "industry," namely the sales process. The computer system organizes specific information to assist salesmen or saleswomen (referred to generically as "sellers") and management in making a presentation to a potential purchaser ("prospect"), in a
30 methodical and consistent manner. Use of the system by a seller produces a number of practical

- 2 -

benefits, including a more effective matching of the prospect's needs to one or more specific products or services to the needs of the prospect, as well as faster determination of appropriate financing arrangements. This in turn results in a more satisfactory experience for the prospect and better on-the-job training for an inexperienced seller, both of which lead to more effective utilization of capital by the seller or his or her employer.

In a nutshell, the computer system reduces costs associated with selling, resulting in exactly the same benefits ---- lower cost and more effective utilization of capital ---- as systems which reduce costs associated with research, development, design, manufacturing, maintenance, etc.

1.4 Human-Factors Problems in Large-Volume Sales Organizations

The sales process can be usefully thought of as an interaction between a prospect and a seller. When performed correctly, the process comprises a logical series of exchanges of information between the seller and the prospect, between the seller and management, between management and a credit bureau, etc. The actual steps will vary depending upon the type of product and the industry, but the concept of the sales process being a sequence of definable information exchanges remains the same.

Historically, however, the actual process of selling, when done on a large scale, has been a disorganized one. Some people are thought of as "born sellers" and need little training to be effective. With suitable training, many other individuals can learn the sales process and achieve good results. In large sales organizations such as car dealerships, however, turnover is frequently high. As a result, it is often not possible to count on having a population of sellers who all either are born sellers or have had suitable training. That means that variations in natural ability and training lead to what amount to inefficiencies of scale, with a concomitant reduction in productivity.

Such inefficiencies are not inherent to large-scale sales. A significant weakness of selling on a large scale is the inability to enforce a certain measure of standardization of the sales process on large numbers of sellers so that they consistently utilize proven sales techniques.

- 3 -

Sales efficiency (defined here as the ratio between sales consummated to prospective buyers dealt with) improves dramatically when sellers record sufficiently complete data on sales prospects to achieve other goals, such as follow-up communication by phone or mail with those prospects that did not make a purchase, correct determination of closing ratios for each individual seller, or analysis of the advertising source that initially captured the prospect's attention. Inefficient sellers can be given additional training or, if necessary, weeded out when correct determination of sales efficiency ratios for individual sellers can be made accurately, quickly, and with reduced overhead. Advertising efficiency (defined here as the ratio of advertising dollars spent to the gross sales volume produced) is enhanced by analyzing the advertising sources that initially capture prospect attention.

An illustration of the need for such a system can be seen in a car dealership, an area in which very large dollar volume sales occur and the sales process is sometimes poorly administered. In general, dealerships have several characteristics in common:

1. Due to less-than-perfect (or even virtually non-existent) pre-employment screening, dealerships may hire sellers that lack true sales proficiency, a problem in most types of retail sales operations.
2. Due to long hours, Saturday work days, and a poor industry image, car dealerships may suffer from high levels of personnel turnover, particularly in the sales departments (in which 100%+ turnover per year is not uncommon).
3. Due to turnover, dealerships are faced with a constant re-training need, which in some cases is poorly accomplished.
4. Many dealerships hire experienced sellers from other dealerships on the assumption that they are good at what they do and do not require training, when in fact these experienced sellers may use very poor sales techniques.
5. Many dealerships refrain from hiring new, inexperienced sellers because they do not want to make an investment in training or suffer loss of productivity as a new seller comes up to speed.

- 4 -

6. Ironically, dealerships do not want to invest in sales training precisely because turnover is high and the investment would be "wasted" in their view. This tends to produce high failure rates among new sellers.

5 1.5 Prior Attempts at Standardizing the Sales Process

A scattered few vehicle manufacturers (e.g., Lexus, Infiniti, and Saturn) have spent large amounts of time and money attempting to improve the quality and consistency of procedures to control the sales process. Dealerships that exert control over the vehicle sales process have in general been far more successful than those that have not. Many of these dealerships have
10 elaborate pencil and paper control procedures. Some employ computerized systems, but as far as is known they record data only after the fact.

1.6 Long-Felt Need

Despite the modest success of these procedures, direct real-time supervision of the sales
15 process has long been recognized as difficult. To be effective, such supervision must take place where the sales presentations are made, i.e., in changing physical locations throughout the dealership, not at a desk or counter where a supervisor can observe. A sales manager's presence during the conversations between the seller and the prospect, however, is likely to undermine the rapport-building that can be critical to the success of the sales process.

20 The problem is exacerbated by the need for ready communication between the seller and his or her manager, or "control desk." Thus, the need for direct managerial supervision is simultaneously created and made more difficult by the nature of the business. The need is highlighted by the fact that, because considerable advertising dollars are invested in attracting new business to the dealership, each prospect that is handled less than optimally may represent a
25 substantial lost profit opportunity.

2. SUMMARY OF THE INVENTION

A computer system in accordance with the present invention addresses many of these problems, including improvement, standardization, and enforcement of the sales process;

- 5 -

efficient training of new sellers; and real-time control of the process by management. The system comprises one or more handheld computer units used by sellers that may be linked with a central computer unit. Each dealership decides the exact sequence that it would like its sellers to follow. The handheld unit then prompts the seller with a standard script to be followed at each
5 step in the process after a prospect enters the dealership. The prospect's responses to the scripted questions are used to identify the prospect's motivation (e.g., safety) or specific interest (e.g., trailer towing capacity). Software switches can be used to indicate motivations or specific interests. The switches are monitored during the sales presentation. When a motivation or interest is identified, the handheld unit prompts the seller to introduce information corresponding
10 to the identified interest.

3. BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1 is a block diagram of a system in accordance with the invention.

Figure 2 is a perspective view of a specific embodiment of a handheld unit in accordance
15 with the invention.

Figures 3 through 21 are screen prints of illustrative screen displays created on a handheld unit by a specific implementation of software in accordance with the invention. The screen displays, discussed in more detail below, implement the invention for a car dealership.

Figures 22 through 70 are illustrative scripts used in a specific implementation of the
20 invention for a car dealership. The organization of the scripts is discussed below.

4. DETAILED DESCRIPTION OF SPECIFIC EMBODIMENTS

4.1 Overview of Illustrative Embodiment

One illustrative embodiment of the invention takes the form of a system for enforcing
25 recording, by a seller, of information about a vehicle-purchase prospect at an automobile dealership. In the interest of clarity, not all features of an actual implementation are necessarily described in this specification, although many additional details of such an implementation can be found in the microfiche appendix. It will of course be appreciated that in the development of any such actual implementation (as in any computer-system development project), numerous

- 6 -

engineering and programming decisions must be made to achieve the developers' specific goals and subgoals (e.g., compliance with system- and business-related constraints), which will vary from one implementation to another. Moreover, attention will necessarily be paid to proper programming practices for the environment in question. It will be appreciated that such a development effort might be complex and time-consuming, but would nevertheless be a routine undertaking of system development for those of ordinary skill having the benefit of this disclosure.

As shown in Figure 1, at its most basic, the illustrative system comprises one or more seller computer units 110 operated by sellers and may also include a central computer 105. The seller computer unit 110 may be of a size suitable to held in a seller's hand, referred to simply as a "handheld" unit, although it may be held in the seller's hand, used on a table or on the seller's lap, suspended from a strap around the seller's neck, etc. The illustrative examples discussed below all involve such handheld units. Alternatively, the seller computer unit 110 may comprise a fixed unit, e.g., a desktop computer with suitable programming.

The handheld computer unit 110 manages a sales-information data store, utilizing any convenient database management system (DBMS) software. This sales-information data store may also be located on the central computer. The external data store(s) are remotely located at places such as vehicle manufacturers, credit bureaus, and credit granting institutions on their computer systems 115.

4.2 The Sales-Information Data Store

The sales-information data store, which may be maintained at or by the handheld computer unit 110, or at the central computer 105, or both, includes a number of specific databases. Virtually any of the databases referred to herein can be either local databases on the handheld unit (updated periodically from a central computer or other data store, e.g., via a serial or parallel cable, a network connection, a radio link, or an infrared link) or remote databases located on the central computer, accessed through a conventional disk search or through an on-line query. Some or all of the databases may be combined if desired into a single complex

- 7 -

database, as will be recognized by those of ordinary skill having the benefit of this disclosure.

The databases include:

(1) a vehicle-inventory information database, which can include both a dealer's database as well as those vehicles in the inventory of other dealerships in a commonly owned group of dealerships. Inventory information is valuable when the seller cannot locate the particular item sought by the prospect;

(2) a customer database, containing conventional information about customers who have made purchases, enabling the seller to identify a prospect as a valuable repeat customer if one should return to the dealership;

(3) a prospect database, likewise containing similar information about prospects who have visited the dealership. With this information, management can determine if there is a pattern in the point at which sales processes are breaking down, or whether a certain seller suffers from very poor sales efficiency. Very importantly by interrogating this database a prospect can be identified as a returning prospect. A returning prospect, known in the auto industry as a "be-back" prospect, has a percentage likelihood of successful consummation of sale that is easily triple that of a prospect on a first time visit. The reason for this is that a "be-back" prospect has completed his or her shopping process and is now ready to make a purchase. For this reason a "be-back" prospect is especially valuable and deserves special attention. Further, the availability of such information saves the time involved in re-entry of data if the prospect returns to the dealership at a later date;

(4) a pending-transaction database, referred to colloquially herein as a "deal" database. Typically a record is started in the pending-transaction database when the first actual offer is made to or by the prospect. Stored information on pending transactions allows managers to monitor sales transactions as they are taking place, enabling them to insert themselves into the sales process if a deal begins to turn sour; and

(5) control-record information, which can provide, for example: data on financing and leasing plans; data on taxes and fees that would apply to the particular sale; information on other products or services frequently sold in conjunction with the desired purchase item.

- 8 -

information on commission rates that apply to various components of the sale, or the sequence and content of each step in the sales process.

4.3 External Data Stores

5 Useful information may be contained within databases at one or more external data stores 115 such as manufacturers, credit bureaus, and credit-granting institutions. For example, vehicle manufacturers commonly maintain real-time updated databases of vehicles on order, in production, in transit, and in the inventories of all dealerships nationwide. When a situation is encountered where the dealership does not have on hand the vehicle that the prospect desires, the 10 seller can access this external data store from a handheld computer to see if a suitable unit exists somewhere in the distribution system.

These external data stores may be accessed directly from the handheld unit or through the communications network to the central computer that has a conventional modem attachment to the telephone network to the vehicle manufacturer.

15

4.4 The Hand-Held Computer Unit

The handheld computer unit 110, referred to as a handheld unit, may be a custom-designed unit or a suitably programmed subnotebook computer or personal digital assistant (PDA). It may be a stand-alone unit; or it may be designed for use as a smart wireless terminal 20 in a larger system including a central computer unit 105; or it may be designed to operate in either stand-alone or smart-terminal mode at the user's option.

A) WIRELESS LINK 120: The handheld unit 110 may have a conventional communications interface or link 120 to the central computer unit 105 or to other handheld unit(s) 110, preferably a wireless link 120 to enable user mobility. The wireless link 120 may take the form of, e.g., a 25 radio modem, an infrared beam, or similar devices.

B) INPUT DEVICE: The handheld unit 110 has a conventional input device operable by the seller for recording data about the prospect, along with suitable conventional programming for managing the input process. The input device may take the form of, e.g., a keyboard; a touchscreen such as those found on many PDAs; a pointing device such as a mouse, trackball, or

- 9 -

J-stick; or a voice-recognition unit. The input device may also have an audio recording input capability.

C) TRANSMISSION OF PROSPECT DATA: The handheld unit 110 may include programming for transmitting prospect data to the central computer unit 105 or to other handheld units 110 via the communications link. The prospect data may be transmitted to the central computer unit 105, but may also be retained locally at the handheld unit 110.

D) SALES INFORMATION REQUESTS: The handheld unit 110 includes programming for interrogating the sales-information data store to obtain information requested by the seller. This may include, e.g., inventory information to determine which cars are in stock or can be obtained quickly.

E) DISPLAY: The handheld unit 110 includes a conventional display (e.g., an LCD display) and suitable programming for displaying requested sales information to the seller. As noted above, display of the requested information may be contingent on the seller having entered all required prospect data and complying with steps in the sales communications process that is required by sales management.

F) LOCAL DATA STORE: The handheld unit 110 may include a local data store (e.g., read-write memory or "RAM," flash memory, or a hard disk drive) for locally storing some or all of the sales information data store. This permits the handheld unit 110 to operate independently of the central computer unit 105 if desired, advantageously reducing wireless communications traffic and permitting use of the handheld unit 110 if the central computer or wireless communications link are inoperable.

G) EXTERNAL DATA STORE: The handheld unit 110 may access databases at external locations such as the external data store 115 via direct communications or by communications over the wireless link 120 to a central computer 105, which has a conventional communications link over telephone lines to the external data store. The communications link may be a modem-type link or a direct digital connection, e.g., an ISDN line, a T1 or T3 line, etc.

4.5 Sales Communication Process

A) SPECIFIED SEQUENCE: The handheld unit 110 includes programming to prompt the seller to perform a specified sequence of steps in a desired sales communication process. The programming may take the form of pre-stored scripts, in a suitable macro-like script language, that are conventionally interpreted by an interpreter (or alternatively are conventionally compiled into executable form) and which, when executed by the handheld unit 110, cause the handheld unit 110 to display appropriate messages on a display.

Different scripts may be used for different sales contexts. For example, a script for an in-person visit by a prospect may prompt the seller to handle the encounter differently than for a telephone inquiry.

The sales communications process(es), and thus the script(s), will normally include obtaining prospect data and recording it in a data store in the handheld unit 110; the scripts preferably take into account the prospect data as it is entered by the seller. For example, if the initial prospect data entered by the seller indicates that the prospect is young, then the programming script may prompt the seller to ask whether the prospect would be interested in a first-time-buyer financing package and to record that prospect data.

B) PRODUCT PRESENTATIONS: The handheld unit 110 may include programming to display a series of scripted product features and benefits. These scripts may vary based upon the particular product that the prospect is interested in. A comprehensive product presentation is key element of a successful sales process.

C) RECORDING OF DATA: For greater usefulness of the system, the seller is asked to record the prospect's personal information such as name, address, etc., early in their meeting. As the seller records the information into the handheld unit 110, the information may be conventionally transmitted (on a real-time basis or periodically in a batch) to other handheld units 110 or to the central computer unit 105 for storage in the appropriate database for use in a conventional sales prospect follow-up system. Thus, no matter how the sales transaction ends, the dealership will always have a record of the prospect's visit and can follow-up the visit with a letter or phone call.

- 11 -

Human factors are a disincentive to comply with recording of prospect data: Since sellers are evaluated on their sales efficiency, they have a disincentive to record data on prospects that do not purchase since this would reflect negatively on their sales efficiency ratios. Historically for this reason sellers in this situation have done a very poor job of collecting
5 prospect data in spite of its obvious usefulness to the dealership.

D) INCENTIVES TO COMPLY WITH SALES PROCESS: Notably, the sales-information-request programming of the handheld unit 110 includes one or more program routines to deny access by the seller to the sales-information data store and to the remote communications links to the external data sources, and to display an appropriate reminder message, if the seller has not
10 complied with the specified steps in the sales process. This gives the seller a large incentive both to comply with the process and to record data as required by the process. For example, the program routines may prevent the handheld unit 110 from accessing the vehicle-inventory information database if all required prospect data has not been entered. Alternatively, the routines may permit the handheld unit 110 to obtain the requested data from the sales
15 information data store, but then not permit the data to be displayed until all required prospect data has been entered. As with many of the program routines described for the handheld unit 110, these program routines may equivalently be located in and control the central computer unit 105 to prevent that unit from transmitting requested data to the handheld unit 110.

E) TIME STAMPS: The illustrative handheld unit 110 includes suitable conventional
20 programming for recording time stamps to identify the time and/or duration of performance of respective steps in the desired sale communication process. The time stamp records are used to record the actual time (either clock time or elapsed time during the sales encounter) at which the seller records specified information. This permits sales management to confirm with reasonable confidence that the seller is in fact performing the appropriate steps in the sales communication
25 process instead of, e.g., recording fabricated or "bogus" data all at once. For example, if the manager sees that a certain seller's tour of the dealership facilities with a prospect lasted only 15 seconds, the manager knows the seller has circumvented that step in the process and can counsel him or her. The time stamps can both be recorded locally at the handheld unit 110 or uploaded to the central computer unit 105 via the communications link for statistical analysis of seller

- 12 -

performance. Alternatively, the time stamp records can be created at the central computer unit 105 as prospect data and other data are transmitted by the handheld unit 110.

5 F) EXTERNAL CHECKS ON PROCESS COMPLETION: Suitable programming can be included in the handheld unit 110, the central computer unit 105, or both, for receiving and processing a signal from an external device indicating that a specified step in the sales communication process has been completed. The external device may be, e.g., a sensor in an vehicle key storage machine that signals when a particular seller, identified by a password or an electronic keycard (similar to a bank automated teller machine card), checks out the keys to a car for a test drive. Other external devices may be advantageously utilized to verify the physical location of the seller at a particular time, thus serving as an additional check on the seller's compliance with the specified sales communication process.

10 Similarly, programming can be included for sending a signal to a gate controller to open a vehicle access gate. The seller, when driving out of the dealership parking lot for a test drive, thus can use the handheld unit 110 to send a signal to the gate controller, either directly or via the central computer unit 105. The handheld computer 110 logs the fact that the seller is leaving the premises on a test drive with the prospect in question. Again, this verification of the seller's physical location at a particular time serves as a check on the seller's compliance with the sales process.

20 G) SELECTIVE AUDIO RECORDING: Conventional hardware and suitable programming may be included in the handheld unit 110 for selective audio recording of a conversation between the seller and the prospect. Selective audio recording of the actual conversation between the seller and the prospect can be useful. For example, Saleswoman A may be known to perform well in obtaining initial prospect wants and needs. Audio recording of this portion of her conversation with the prospect may be deemed unnecessary and thus can be skipped. On the other hand, Salesman B may be weak in this area; when he indicates on the handheld unit 110 that he is in this phase of the desired sales communication process, the handheld unit 110 may automatically commence audio recording until the next phase of the conversation. Sales management is then able to selectively listen to the actual sales process as it progressed and counsel the seller on sales techniques. If required by privacy laws, the handheld unit 110 may be

- 13 -

programmed to play an audible message on commencement of recording, such as "to help ensure quality service, this conversation may be monitored or recorded."

H) FINANCING ASPECTS: The handheld unit 110 may include programming for transmitting identifying information about the prospect and a creditworthiness inquiry to a financial institution computer 125, and for receiving and processing a creditworthiness report
5 from that computer. If the handheld unit 110 includes an input device that can store a signature digitally, then the prospect can be asked to "sign" an authorization granting the dealership permission to access the user's credit history. The input device may be a conventional pen- and touch-screen interface of the kind found in some PDAs; a similar device of the kind found at
10 some cash registers for credit card authorizations; or the like. Access to the financial institution computer 125 may be via direct link or may be through a conventional data link such as a modem controlled by the central computer unit 105. The financial institution may be a credit bureau or an actual financing source. In the latter case, the financing source may perform its own credit check and make a preliminary creditworthiness determination to be transmitted back
15 to the seller. This in turn helps the seller qualify the prospect, i.e., to determine the price range of the vehicle for which the prospect is likely to be able to obtain financing.

I) COMPUTATION OF FINANCE TERMS: The handheld unit 110 may include conventional programming enabling the seller to use it as a financial calculator for calculating, e.g., lease payments, loan payments, and the like. As the sales process progresses, the prospect data,
20 creditworthiness report, and finance terms may be transferred to another handheld unit 110 or a central computer system 105 for finalization of paperwork or for negotiation purposes as described below.

J) REAL-TIME NEGOTIATION: The handheld unit 110 programming may include routines to permit the seller to send offers to and counteroffers to other handheld computers 110 or the
25 central computer unit 105. A sales manager or similar person may read and respond to these exchanges, e.g., using another handheld unit 110 or a terminal 130 attached to the central computer 105. By eliminating most of the seller's trips back and forth from the prospect to the sales manager's desk, much of the time needed to consummate a sale is reduced. This reduction of time spent in the negotiating process is a vital element in improving sales efficiency since if

- 14 -

this process becomes extended, the prospect is increasingly likely to have misgivings and decline to consummate the sale. The capacity for real-time negotiation becomes increasingly valuable in situations of high activity (like a Saturday), when there are a large number of sellers per sales manager, when the average experience level of sellers is low, when there is a large number of
5 sellers working at a single location, or when the physical distances at a given location between sellers and sales management are large.

K) REAL-TIME SALES PROGRESS DISPLAY: The programming of the handheld unit 110 may include routines for real-time computation and display of sales progress information applicable to the transaction. For example, the likelihood of closing the sale may be estimated
10 and displayed on the handheld unit 110 by comparing factors such as (a) the length of time that the prospect has consented to spend with the seller during each step of the sales process, and/or (b) the number of steps in the process that have been completed, with historical data on previous sales process outcomes (e.g., stored in the sales information data store) for that dealership, that city, etc. This likelihood may be displayed in a variety of ways (e.g., a percentage number, a
15 gas-gauge indicator, etc.) to show the likelihood of closing the sale going up as each step is completed. This encourages the seller to perform each step thoroughly, taking sufficient time to communicate the desired information to the prospect.

L) REAL-TIME SALES COMMISSION DISPLAY: The programming of the handheld unit 110 may include routines for real-time computation and display of the commission that would be
20 paid to the seller if the sale were to be consummated on the specified terms. This can serve as a powerful sales motivator for the seller.

M) COMPARATIVE RANKING AMONG SELLERS: The handheld unit 110 may also be programmed to display a list of sellers at the dealership, ranked by performance for a given period, e.g., by sales achieved in a given month. This constantly updated real-time display of
25 sales rankings also can serve as a sales motivator for sellers.

N) DETERMINATION OF PARTICULAR PROSPECT INTERESTS: The programming and data structures of the handheld unit 110 may also be designed such that answers to scripted questions provide an indication of the prospect's general interests (sometimes referred to here as "motivations") or specific interests (sometimes referred to here as "hot buttons"). For example,

- 15 -

the prospect's responses to questions may indicate that the prospect is generally interested in safety. Other typical prospect motivations include performance, economy, and style, to name but a few examples. Moreover, the prospect may be specifically interested in features of a car such as air bags, trailer towing packages, etc. Some or all of these various interests may have different
5 degrees of importance to different prospects.

If a prospect's answers to questions (alone or in combination) indicate the presence of one or more general interests or specific interests, that fact(s) is noted by setting one or more flags within an appropriate data structure, either within the handheld unit 110 or within the central computer unit 105. The handheld unit 110 then prompts the seller to ask specific additional scripted questions or make specific additional comments related to that interest to help
10 focus the discussion. The handheld unit 110 thus helps the seller do what an expert seller likely would do intuitively.

This can be implemented in a variety of ways. For example, the programming of the handheld unit 110 may be designed so that the required flags are maintained in a suitable data structure in memory within the handheld unit. The term "flag" is used here to include values of
15 specific data variables. For example, if a prospect's responses indicate that she has two children, ages 4 and 2, the fact that she has children and their respective ages may be recorded in appropriate variables and used as flags concerning safety as a motivation and for fold-down child seats as a possible hot button. Then again, if the prospect's answers indicate that she
20 affirmatively does not plan to use the car to carry her children (e.g., she is buying the car for her college-bound oldest child), the fact that she has younger children may be overridden.

The overall logic of the programming in this regard is quite simple: At one or more appropriate points in the encounter between the seller and the prospect, if a flag is set indicating that the prospect has a particular motivation (as determined, e.g., by the prospect's responses to
25 particular questions), then the seller is prompted to provide information or ask questions relevant to that motivation. For example, if a flag is set indicating that safety is a motivation for the prospect, then at one point in the encounter the seller is prompted to mention the fact that the vehicle has side air bags; at another point the seller is prompted to mention the vehicle's built-in, fold-down child seats; and so on.

- 16 -

Motivation switches and hot buttons of this kind can also be implemented in whole or in part in the central computer unit 105. For example, the central computer unit may determine from the prospect's ZIP code that the prospect lives in an area in which mini-vans are popular. In response, it may prompt the seller, via the handheld unit 110, to suggest to the prospect that
5 "you know, a lot of people in your neighborhood are buying this model of mini-van."

As would be apparent to one skilled in the art, conventional programming methods can be used to determine a prospect's motivations and hot buttons. Thus, the actual implementation of the required programming is immaterial here.

O) SELECTIVE PRESENTATION OF PRODUCT OPTIONS: Many products sold to the public
10 include various options. For example, cars, trucks, and similar vehicles often come with options such as air conditioning, a trailer-towing package, built-in child seats, etc. A seller will frequently make a sales presentation about a specific example of a product, e.g., a specific car or truck on the lot. It may be desirable for the seller to talk only about options actually installed on that specific car or truck. An experienced seller is likely to know this. A novice seller, on the
15 other hand, may not be aware which options are installed on the particular car or truck (or may not even be aware of the extent of the available options).

The programming and data structures of the handheld unit 110 therefore may be designed to be sensitive to the actual options installed on a particular vehicle. The vehicle identification may be obtained and inputted into the handheld unit 110 in any convenient manner, e.g., by
20 selecting from a menu of available vehicles having specified characteristics or by direct entry of the factory-applied vehicle identification number (VIN). Information about the options installed on that particular vehicle may be stored in the sales-information data store as described above.

The programming for the sales communication process can then easily be designed to prompt the seller to talk at a suitable point about the specific options already installed on the
25 vehicle, e.g., in response to the motivation switches and hot buttons described above. The script for the sales communication process can include suitable remarks for the seller to make, e.g., "this particular car has the new high-performance engine already installed." Additional information about the option can be displayed if desired, either automatically or in response to a command inputted by the seller.

- 17 -

The programming and data structures of the handheld unit 110 can also be designed to provide the seller with a list of options that could be installed on that vehicle if desired. In that way, if the prospect indicates interest in other options, the seller can respond with an appropriate list.

5 If the prospect indicates interest in an option not already installed on that vehicle, the handheld unit 110 may identify from the sales-information data store a vehicle that does already contain that option and display that information to the seller.

If the prospect is trying to decide which specific vehicle he or she prefers, the handheld unit 110 may display a compare-and-contrast list of options for each vehicle, e.g., in table form.

10 It will be appreciated by those of ordinary skill having the benefit of this disclosure that programming of these option-sensitive features is conventional. A simple implementation entails providing, in the sales-information data store, a data structure with option information about each specific vehicle on the lot. Depending on the implementation, the data structure may include a flag indicating the presence of an option and/or more detailed information about the option. The portion of the programming that causes display of a script on the handheld unit 110 simply checks the data structure to determine whether a particular option is present and modifies the script accordingly (possibly depending on other factors such as whether the prospect has expressed any interest in the option).

P) INCORPORATING PROSPECT INFORMATION INTO CUSTOMIZED SCRIPTS: The data
20 collected about the prospect during the sales presentation can be used to customize the script displayed to the seller through simple parameter substitution. The customized script can reflect information such as the prospect's name, spouse's name, children's names, current vehicle owned, mileage on current vehicle, etc. This may help the inexperienced seller build a rapport with the prospect in the same way that experienced sellers do. The customization can be readily
25 implemented in conventional fashion in the programming of the handheld unit 110, the central computer unit 105, or both, as convenient.

The simplest example of such customization is probably the parameterized substitution of the client's name into the script. Some sellers believe that use of the prospect's name is a key factor in building a rapport with the prospect. Suppose that the seller has input data into the

- 18 -

handheld unit 110 (or retrieved it from the sales-information data store) indicating that the prospect is female, she is a physician, and her last name is Jones. At an appropriate point the script might include a reminder to work the prospect's name into the conversation. The unsubstituted script might read "<Title> <Last_Name>, if you have time, let's take a test drive."

5 As displayed to the seller on the handheld unit 110, it would read "Dr. Jones, if you have time, let's take a test drive."

As a more sophisticated example, suppose that the prospect, Dr. Jones, has said that she has a one-year old son John and that she is interested in a particular model of mini-van because it has built-in child seats. If the script is option-sensitive as described above, at an appropriate point it can suggest that the seller make a comment such as "You see the child seats back here --
10 they're designed for children three months to five years old, so <Child_Name> should be able to use it till he's big enough to go without one." As displayed to the seller on the handheld unit 110, the script reads ". . . so John should be able to use it till he's big enough to go without one."

15 Q) "RECAPPING" SCRIPT SEGMENT: One skill of an experienced seller is the ability to remember those features of a product that aroused the prospect's interest during the sales communication process and to recap them orally during the closing stages of the process. To the extent that the seller provided data to the handheld unit 110 indicating the prospect's interest in specific options (or if the data was already present in a sales-information data store), then upon a
20 suitable command from the seller (possibly in response to a reminder prompt from the handheld unit 110), a recap list of those options is displayed on the handheld unit 110. Alternatively, the handheld unit 110 can display the recap list automatically when the information available suggests that the sales communication process has entered a specified phase.

R) "MANAGER HELP" BUTTON: For any given prospect, an inexperienced seller is likely
25 to encounter difficulties at some point. The seller might not be saying the right things at the right time. There might be a personality conflict, mild or severe. There are undoubtedly dozens of reasons why any given sales communication process might go badly for an inexperienced seller.

- 19 -

Consequently, inexperienced sellers are trained to go get their managers if they sense that they are losing control of the sales communications process with a given prospect.

Unfortunately, this often entails a seller asking the prospect to wait while the seller finds the manager. As often as not, the prospect seizes the opportunity to depart gracefully — resulting in
5 a lost sales opportunity. This can cause inexperienced sellers to be reluctant to leave the prospect to go the manager. In those cases where an experienced sales manager can be discretely brought into the sales communication process, however, there is a reasonable chance that the situation can be turned around and the prospect converted into a buyer.

To address this situation, the handheld unit 110 may include a “Manager Help” button.

10 The Manager Help button is very similar in concept to the “panic button” found on handheld units available for some home-security systems — a householder can keep the handheld unit on or near his or her person; pressing the panic button transmits a signal to the security service, which sends someone to investigate.

The Manager Help button may be conventionally implemented in hardware or,
15 preferably, in software as an icon or menu choice on the display of the handheld unit 110. When the seller “hits the button” (literally or figuratively), the handheld unit 110 signals the central computer unit 105 that a manager’s assistance is required. The central computer unit 105 then generates an appropriate message on, e.g., a terminal in the sales manager’s office. The message may include information such as the seller’s identity and a summary of what has transpired in
20 the sales communication process with that prospect. The sales manager can then “stop by” and very naturally introduce him- or herself into the sales process.

The Manager Help button can be implemented so that pressing the button brings up a menu or a series of icons indicating different kinds of available assistance. The available assistance might include items such as “Soft drinks” (resulting in someone coming to take the
25 prospect’s drink order), “Service department,” (resulting in a service-department representative coming to join the conversation), and the like. One or more of these items can be in addition to, or in lieu of, the manager assistance described above.

s) CACHING OF SCRIPTS, ETC.: If a suitably fast wireless link is available between the handheld unit 110 and the central computer unit 105, then the handheld unit can be programmed

- 20 -

to interact with the central computer unit on a real-time basis while in use and while in range of the central computer unit. Thus, when a seller is using the handheld unit 110 in range of the central computer unit, it effectively acts as a wireless terminal for the latter unit.

In that way, the seller uses the most current version of the scripts, sales information, etc. (referred to here as the "information load" of the handheld unit), as is practicable. That means, for example, that the seller will have up-to-date information about the vehicle inventory; he or she will not attempt to sell a prospect a vehicle that has already been sold, nor attempt to show a vehicle that is already being test-driven by another prospect (assuming that such information is kept current in the central computer unit 105).

But the handheld unit 110 is designed to be used in a mobile environment. There likely will be times when the handheld unit is out of range of the central computer unit 105, e.g., if the seller is on a test drive with a prospect.

To address that problem, the information load may be periodically downloaded from the central computer unit 105 into storage (preferably nonvolatile storage such as a hard disk drive or nonvolatile RAM) on the handheld unit 110. That makes the information load available for use by the seller even if the handheld unit loses contact with the central computer unit. In concept, such downloading is much like the "caching" of Web pages, graphics, etc., by browsers such as Microsoft's Internet Explorer and Netscape's Navigator, so that the Web pages and graphics can be viewed even if the user does not have a current connection to the Internet.

The downloading operation is preferably performed automatically upon startup of the handheld unit 110, e.g., through the use of an AUTOEXEC.BAT file or a Windows 95 Startup program. Such downloading, when successful, ensures that the handheld unit gets a current information load.

T) DATA COMPRESSION: If desired, the downloading may use data-compression and -decompression techniques to speed up the data transmission. That is, the central computer unit 105 may use any of a variety of conventional data-compression algorithms to substitute short strings of characters in place of long strings. For example, in the so-called dictionary approach, the central computer unit 105 would transmit comparatively short codes in place of longer strings of data characters; the handheld unit 110, using a compatible dictionary, would translate

- 21 -

the codes back into the original longer strings of data characters. (The programming of the handheld unit 110 can be designed to store the data in compressed form and decompress on an as-needed basis instead of decompressing it immediately upon receipt.) Well-known examples of dictionary-based data compression include those pioneered by Lev and Zempel as well as several variations on the basic LZ approach such as Lev-Zempel-Welch (LZW); in these examples, dictionaries are built up "on the fly" to match the actual data transmitted.

U) REFRESH-TYPE UPDATING: If the information load is downloaded into nonvolatile storage in the handheld unit 110, the downloading operation can be conventionally designed to function in the well-known "refresh" mode. That is, the central computer unit 105 determines which portions of the desired current information load are already present in the handheld unit 110 and downloads only those portions that are not already present. The refresh operation may be performed in any convenient manner. One simple approach is for the central computer unit 105 to send a signal to the handheld unit 110 directing the handheld unit to provide a directory listing of the separate data files making up its information load, including the dates and times of each file. That information can be used by the central computer unit to determine which files should be updated. Alternatively, conventional record-level marking or tagging can be used to determine which if any record(s) in a database of scripts, sales information, etc., are candidates for updating.

V) PERIODIC UPDATING OF DATA: After initialization of the information load, selected portions thereof may be updated from time to time to reflect ongoing changes in the sales information data store. For example, a car dealership may refresh its handheld units 110 by downloading updated data whenever a specific vehicle is sold, so that other sellers will no longer attempt to test-drive that vehicle; or whenever new vehicles are added to the inventory. The update operation may be performed on a periodic basis, e.g., once per hour, once every four hours, etc. It may also be performed on an as-needed basis, e.g., when an inventory item (such as a specific vehicle) is sold or is added to the inventory. The update operation could be performed in some combination of periodic and as-needed basis. The update operation may be initiated by each handheld unit 110 or by the central computer unit 105.

- 22 -

4.6 Description of Specific Illustrative Embodiment

HARDWARE: One possible embodiment of the handheld unit 110 is the Fujitsu Stylistic 1000 RF, shown in Figure 2 identified by the reference numeral 200 / 110, running the Microsoft Windows 95 operating system. In implementations involving outdoor sales work (e.g., car dealerships), the available transfective monochrome liquid-crystal display (LCD) option is preferred for the screen 205 for greater visibility in sunlight. This model of the Stylistic 1000 includes an antenna 210 for a spread-spectrum radio; if a different model without a built-in wireless link is used, then a separate unit such as an ARLAN wireless LAN adapter can be inserted into the PCMCIA slot (sometimes called the PC Card slot) on the handheld unit. Data entry can be accomplished with a stylus 215. The unit advantageously includes a hot-swappable battery, permitting the battery to be changed without powering down the unit. At this writing, more detailed information is available at

<http://www.fpsi.fujitsu.com/products/st10RF.htm>.

A) SOFTWARE - SCREEN DISPLAYS, DATA ENTRY: Figures 3 through 21 show examples of screen displays and data entry fields. The examples are from an experimental prototype of the invention designed for use in car dealerships. The Figures show fictitious prospect data in the displays. It will be appreciated by those of ordinary skill having the benefit of this disclosure that other screen arrangements are possible and, in other contexts, may be preferable to the ones shown here; for example, an implementation of the invention for use in a jewelry store obviously will be different from the car-dealership illustration shown in the drawings. Which specific screen arrangement to use in a given context is a matter of design choice for the artisan.

As seen in Figures 3 through 20, the prototype display- and data-entry screens for a given prospect are conventionally organized by representations of notebook tabs shown at the bottom of each screen. A given screen can be brought up on the display 205 of the handheld unit 110 by clicking with the stylus 215 on the appropriate tab. As is customary for such a display organization, the tab for screens not actually being viewed may be shown in a different color or shading than the tab for the screen being viewed. The specific prototype display / data entry screens shown in the Figures are described in Table 1 below; three-letter codes correspond to the codes at the lower right portion of various (but not all) screens.

TABLE 1: DESCRIPTION OF SELECTED FIGURES

Figure 3	INF	Prospect info	Basic information about the prospect, e.g., name, address, phone number
Figure 4	PER	Prospect personal data	More detailed information about the prospect such as Internet address, nickname, hobbies
Figure 5	COB	Co-buyer data	Information about a co-buyer such as a husband or wife
Figure 6	WAN	Prospect wants	Details about what the prospect wants in a vehicle
Figure 7	TRA	Trade-in	Information about the car the prospect wants to trade in
Figure 8	APP	Trade-in appraisal	Trade-in appraisal information
Figure 9	SEL	Vehicle search (Attributes and Price / Payment tab)	A form for searching the sales data store to locate vehicles matching specific criteria
Figure 10	SEL	Vehicle search (Options tab)	A form for searching the sales information data store to locate vehicles matching specific criteria
Figure 11		Vehicles found	A list of vehicles found in the sales information data store that match the search criteria, along with detailed information about a highlighted vehicle
Figure 12	VEH	Selected vehicle	Information about a specific vehicle; includes a "Hold for salesman" button in the lower right corner to place a temporary hold on the vehicle
Figure 13	CBI	Credit bureau inquiry	Displays information to be sent to a credit bureau. Includes a "Send" button in the lower right corner, which causes a credit inquiry signal to be transmitted.
Figure 14	OFF	Prospect offer	A screen showing the current status of offers and counteroffers.
Figure 15	SOL	Sold	Information about a specific vehicle sold to a specific prospect
Figure 16	DEL	Delivered	Information about a specific vehicle delivered to a specific prospect

TABLE 1: DESCRIPTION OF SELECTED FIGURES

Figure 17	Select a vehicle position	A graphical touch-screen prompt that brings up script prompts with suggested points for the seller to discuss about the area of the car touched (see Figures 18, 19). If the sales information data store contains enough specific information about the various makes and models of vehicles, additional touch-screen prompts can be "nested," e.g., touching the "Interior" region brings up a list (or diagram) of interior features such as air conditioning, cruise control, etc.
Figure 18	Speed Control	A sample script prompt; includes three navigation buttons Next, Previous, More.
Figure 19	Speed Control	Another sample script prompt.
Figure 20	BEB Sales Manager	A screen brought up when the seller wants to close out the prospect record. Data fields marked by an asterisk are the minimum data that the seller should collect and record to be able to return to the main menu. The "beback" date and time fields indicate when the prospect has indicated s/he will return.
Figure 21		An example of a dialog box with a suggested script and three buttons for the seller to choose from. Includes two navigation buttons, Top and Previous, at the top right of the dialog box.

B) SOFTWARE - SCRIPT BUTTONS: Many of the screens have two rows of "buttons" at the top of the screen (with some buttons grayed out in some of the screens). Clicking on a button in the second row causes the handheld unit 200 / 110 to begin running a script for the

5 corresponding phase or "step" of the sales presentation process as described in Table 2. An asterisk may be displayed in one of these step-related buttons to indicate that the seller has worked through enough of the script for the step in question that the step can be marked as complete. For example, in Figure 3, the GRT button has an asterisk to show that the Greeting

10 step has been sufficiently completed.

The script (reproduced in Figures 22 through 70) prompts the user to say certain things to the prospect and to enter certain data at specific points in the sales presentation process; the data

- 25 -

entered are displayed on the screens described above. Many but not all of the three-letter codes for the scripts are the same as the three-letter codes for the screens listed in Table 1.

TABLE 2: SCRIPTS IN PROTOTYPE SELLER PROCESS

GRT	Greeting the prospect
WAN	Determining the prospect's wants
SEL	Selecting an actual vehicle
PRO	Product presentation (a detailed product-presentation script with prompts for discussion of features found in specific vehicles is in the file SCRIPT.RPT in the microfiche appendix).
DEM	Demo of a vehicle
TRA	Trade-in
SER	Service department (often user-defined to be specific to the dealership)
WRI	Write up the order (offers and counter-offers)
SOL	Update the information on the vehicle sold
DLR	Dealer-defined, e.g., "why should you buy your car here" information

The script, shown in Figures 22 through 70, can be thought of as a flowchart expressed in words. Each "line" of the script, referred to as a record, contains information as described in Table 3 below. Execution of the script by the handheld unit 200 / 110 causes a dialog box (see, e.g., the "Welcome to ABC Motors. How may I assist you today" dialog box shown in Figure 21) to be displayed "over" the screen that is currently being displayed (e.g., the Prospect Info screen shown in Figure 3).

10

TABLE 3: SCRIPT CONTENTS

SCRIPT TEXT	Text to be displayed in the dialog box to prompt the seller to say specific things to the prospect. For example, in Figure 27, at the script record labeled DEM 0100, the seller is prompted to say "Let me start the car, and I'll show you more about the interior of this vehicle."
ANSWER	The text of zero or more buttons, menu choices, etc., to be displayed as part of the dialog box so that, e.g., the seller can indicate the prospect's response to the SCRIPT TEXT. For example, in Figure 27, three potential answers are displayed: OK, No time, and Not buying.

TABLE 3: SCRIPT CONTENTS

GOTO	Indicates that, when this script record is executed, a different screen is to be displayed "under" the dialog box. For example, in Figure 36, script record SEL 0020 contains the entry SEL in the GOTO field. This indicates that when this record is executed by the handheld unit 200 / 110, the "Vehicle search" screen shown in Figure 9 (whose three-letter code is SEL) is displayed under the dialog box.
PUT DATA, FIELD	Specific data values to be entered in specific fields in the sales-information data store. For example, in Figure 38, if the seller clicks on the answer indicating that the prospect's trade-in is being financed by FMCC, then the value "FMCC" is assigned ("put") to the field TRADELIENNAM (trade-in lienholder name).
STEP, SEQ	The next record of the script to be executed (which can vary depending on which prospect response is selected). For example, in Figure 27, if the prospect's answer to "Let me start the car ..." is "OK," then the handheld unit 200 / 110 executes script record DEM 0140, which suggests that the seller "[t]ake the time to explain or review one or more of the interior features covered in the product presentation."
* (asterisk)	Indicates that, when the script record in question is completed, the entire "step" can be marked as complete. For example, in Figure 36, the "Y" entries in script records SEL 0020, 0030, and 0040 indicate that if any of these three records is executed, the entire Vehicle search step in the sales presentation process, whose three-letter code is SEL, can be marked as complete (see, e.g., the asterisk in the SEL button shown at the top of Figure 12).

c) SOFTWARE - OTHER BUTTONS: Referring to Figure 3 as an example, the top row of buttons includes the buttons Show Script; Close Prosp[ect], and Manager. The Show Script button causes the handheld unit 110 to resume running a script that was suspended by the seller (using a Hide Script button, not shown). The Close Prosp[ect] button signifies that the sales presentation has ended, either with or without a sale. The Manager button causes a signal to sent to summon a sales manager as described in Section 4.5(r) above.

d) SOURCE CODE: It will be appreciated by those of ordinary skill having the benefit of this disclosure that much more detail about the operation of the prototype can be found in the source code reproduced in the microfiche source code appendix. The code is written to be compiled with the Microsoft® Visual C++ compiler.

4.7 Other Remarks

Use of the system described above helps management enforce the desired standardization of the sales process. The seller cannot advance through the prescribed sales process until he or she has completed all prior steps. In this way, management is assured that each prospect
5 receives the treatment that has been deemed most effective in making a sale.

For example, the handheld unit 110 ordinarily allows the seller to retrieve and view sales information from the sales information data store for the benefit of the prospect (e.g., to determine whether a particular model is in stock). However, if the seller has not recorded the prospect's personal information such as name, address, and telephone number, the system will
10 not allow the seller to retrieve that information. Thus, unless the seller follows the prescribed program, he or she is effectively prevented from proceeding. However, if the seller progresses through the prescribed steps, the handheld unit 110 may inform the sales management of each step completed successfully. In this way, management keeps abreast of which transactions have been dragging in critical stages, when management assistance might be useful.

15 The system provides other benefits besides adherence to the sales process. New sellers are easily trained on the job: once they learn to use the sales machine, it gives them a step-by-step script to follow, taking the guesswork out of the learning process.

Sellers are prompted through a thorough product presentation of features and benefits. These product presentations are specific to the product that the prospect desired to purchase and
20 are tailored to address both the general and specific interests of the prospect.

Also, management now has an accurate picture of each seller's sales efficiency (ratio between number of sales completed per number of prospects seen). In a paper based system, sellers had a disincentive to record the visits of prospects who made no purchase, so management did not get any real idea of how well each seller was performing.

4.7 Program Storage Device

As noted above, any of the foregoing variations may be implemented by programming a suitable general-purpose computer having appropriate hardware such as a microprocessor, memory, and a communications device such as a modem (preferably wireless for the handheld
25

- 28 -

device 110). The programming may be accomplished through the use of a program storage device readable by the computer and encoding a program of instructions executable by the computer for performing the operations described above. The program storage device may take the form of, e.g., one or more floppy disks; a CD ROM or other optical disk; a magnetic tape; a
5 read-only memory chip (ROM); and other forms of the kind well-known in the art or subsequently developed. The program of instructions may be "object code," i.e., in binary form that is executable more-or-less directly by the computer; in "source code" that requires compilation or interpretation before execution; or in some intermediate form such as partially compiled code. The precise forms of the program storage device and of the encoding of
10 instructions are immaterial here.

* * *

It will be apparent to those of ordinary skill having the benefit of this disclosure that numerous variations are possible from the illustrative embodiments described above. Accordingly, it is the claims below and not the illustrative embodiments that measure the
15 exclusive rights claimed in the invention.

- 29 -

WHAT IS CLAIMED IS:

1. A sales support computer comprising:
 - a) means operable by a seller for recording prospect data about a prospect, including information about at least one particular interest of the prospect; and
 - 5 b) means for prompting the seller to perform a specified sequence of steps in a desired sales communication process during a meeting with the prospect in response to the at least one particular interest of the prospect.
2. The sales support computer of claim 1 wherein the sales support computer is of a size
10 suitable for the computer to be held in the seller's hand.
3. The sales support computer of claim 1 wherein the particular interest is selected from the group consisting of safety, economy, performance, style, trailing towing capacity, side airbags, and anti-lock braking.
15
4. The sales support computer of claim 1 wherein the information about at least one particular interest of the prospect includes information about the composition of the prospect's family.
- 20 5. The sales support computer of claim 1, wherein the prompting to perform specified sequence of steps includes prompting the seller to say specific prospect-related information aloud.
6. The sales support computer of claim 5, wherein the specific prospect-related information
25 comprises the prospect's name.
7. The sales support computer of claim 5, wherein the specific prospect-related information comprises information about a product option in which the prospect has indicated an interest.

- 30 -

8. The sales support computer of claim 5, wherein the specific prospect-related information comprises a recap list of information about product options in which the prospect has indicated an interest.
- 5 9. The sales support computer of claim 1, further comprising:
c) means for prompting the seller with a script of product features and benefits.
10. The sales support computer of claim 1, further comprising:
c) means for displaying a list of options available for a specific product.
- 10 11. The sales support computer of claim 1, further comprising:
c) means for simultaneously displaying information about the availability of one or more specified options for two or more specific products.
- 15 12. The sales support computer of claim 1, further comprising:
c) means for displaying a table of option availability for two or more specific products.
13. The sales support computer of claim 1, further comprising:
20 c) means for summoning assistance for the seller.
14. The sales support computer of claim 1, further comprising:
c) means for retrieving information from an external data store.
- 25 15. The sales support computer of claim 14, wherein the retrieved information comprises consumer credit information.
16. The sales support computer of claim 1, further comprising:

- 31 -

- c) means for retrieving and displaying sales information from a sales information data store; and
- d) means for preventing the seller from perceiving sales information from the sales information data store unless the seller records the prospect data.

5

17. The sales support computer of claim 1, further comprising:

- c) means for retrieving and displaying sales information from a sales information data store; and
- d) means for preventing the seller from perceiving sales information from the sales information data store if the seller does not comply with the desired sales communication process.

10

18. The sales support computer of claim 1, further comprising:

- c) means for accessing an external data store, and
- d) means for preventing the seller from retrieving information from the external data store if the seller does not comply with the desired sales communication process.

15

19. The sales support computer of claim 1, further comprising:

- c) means for recording the duration of performance of respective steps in the desired sale communication process.

20

20. The sales support computer of claim 19, wherein the means for recording the duration of performance of respective steps in the desired sales communication process comprises means for recording time stamps identifying the respective times of performance of the steps.

25

21. The sales support computer of claim 1, further comprising:

- c) means for transmitting a creditworthiness inquiry about the prospect to a financial institution, and

- 32 -

- d) means for receiving a creditworthiness report on the prospect.
22. The sales support computer of claim 21, further comprising:
- e) means for recording a representation of the prospect's signature, and
- 5 f) transmitting a representation of the prospect's signature to the financial institution.
23. The sales support computer of claim 1, further comprising:
- c) means for transmitting a sales offer and means for receiving a response to the
- 10 offer.
24. The sales support computer of claim 1, further comprising:
- c) means for locally storing at least a portion of a sales information data store; and
- d) means for periodically updating said locally-stored portion.
- 15
25. A sales support computer comprising:
- a) means operable by a seller for recording prospect data about a prospect, including information about at least one particular interest of the prospect;
- b) means for prompting the seller to perform a specified sequence of operations in a
- 20 desired sales communication process during a meeting with the prospect, said operations including (1) recording prospect data, and (2) telling the prospect about a product option correlated with the prospect's particular interest; and
- c) means for restricting the seller's ability to use the sales support computer if the seller does not perform the specified sequence of operations.
- 25
26. The sales support computer of claim 25, wherein the particular interest is selected from the group consisting of safety, economy, performance, style, trailing towing capacity, side airbags, and anti-lock braking.

- 33 -

27. The sales support computer of claim 25, wherein the information about at least one particular interest of the prospect includes information about the composition of the prospect's family.

- 5 28. A sales support computer comprising:
- a) means operable by a seller for recording prospect data about a prospect, including information about at least one particular interest of the prospect;
 - b) means for querying a sales information data store to determine the availability of specific products having one or more features correlated with the prospect's
10 particular interest;
 - c) means for prompting the seller to perform a specified sequence of operations in a desired sales communication process during a meeting with the prospect, said operations including:
 - (1) recording prospect data, and
 - 15 (2) telling the prospect about one or more features that are correlated with the prospect's particular interest; and
 - d) means for restricting the seller's ability to use the sales support computer if the seller does not perform the specified sequence of operations.

20 29. The sales support computer of claim 28, wherein the particular interest is selected from the group consisting of safety, economy, performance, style, trailing towing capacity, side airbags, and anti-lock braking.

30. The sales support computer of claim 28, wherein the information about at least one
25 particular interest of the prospect includes information about the composition of the prospect's family.

- 34 -

31. A sales support computer comprising:

- a) means operable by a seller for recording prospect data about a prospect, including information about at least one particular interest of the prospect;
- b) means for querying a sales information data store to determine the availability of specific products having one or more features correlated with the prospect's particular interest;
- c) means for prompting the seller to perform a specified sequence of operations in a desired sales communication process during a meeting with the prospect, said operations including recording prospect data;
- d) means for recording the duration of performance of respective operations in the desired sales communication process; and
- e) means for restricting the seller's ability to use the sales support computer if the seller does not perform the specified sequence of operations.

32. The sales support computer of claim 31, wherein the particular interest is selected from the group consisting of safety, economy, performance, style, trailing towing capacity, side airbags, and anti-lock braking.

33. The sales support computer of claim 31, wherein the information about at least one particular interest of the prospect includes information about the composition of the prospect's family.

34. A sales support computer comprising:

- a) means operable by a seller for recording prospect data about a prospect, including information about at least one particular interest of the prospect;
- b) means for querying a credit information data store to get an indication of the prospect's creditworthiness;
- c) means for prompting the seller to perform a specified sequence of operations in a desired sales communication process during a meeting with the prospect, said

- 35 -

operations including (1) recording prospect data and (2) telling the prospect about one or more product features suggested by one or more particular interests of the prospect; and

- d) means for restricting the seller's ability to use the sales support computer if the seller does not perform the specified sequence of operations.

35. The sales support computer of claim 34, wherein the particular interest is selected from the group consisting of safety, economy, performance, style, trailing towing capacity, side airbags, and anti-lock braking.

36. The sales support computer of claim 34, wherein the information about at least one particular interest of the prospect includes information about the composition of the prospect's family.

37. A sales support computer comprising:

- a) means operable by a seller for recording prospect data about a prospect, including information about at least one particular interest of the prospect;
- b) means for querying a credit information data store to get an indication of the prospect's creditworthiness;
- c) means for querying a sales information data store to determine the availability of specific products having one or more features correlated with one or more particular interests of the prospect;
- d) means for prompting the seller to perform a specified sequence of operations in a desired sales communication process during a meeting with the prospect, said operations including (1) recording prospect data and (2) telling the prospect about at least one of said one or more features; and
- e) means for restricting the seller's ability to use the sales support computer if the seller does not perform the specified sequence of operations.

- 36 -

38. The sales support computer of claim 37, wherein the particular interest is selected from the group consisting of safety, economy, performance, style, trailing towing capacity, side airbags, and anti-lock braking.

5 39. The sales support computer of claim 37, wherein the information about at least one particular interest of the prospect includes information about the composition of the prospect's family.

40. The sales support computer of claim 37, further comprising means for summoning
10 assistance for the seller.

41. A sales support computer comprising:

- a) means operable by a seller for recording prospect data about a prospect, including information about at least one particular interest of the prospect;
- 15 b) means for querying a credit information data store to get an indication of the prospect's creditworthiness;
- c) means for querying a sales information data store to determine the availability of specific products having one or more features correlated with one or more particular interests of the prospect;
- 20 d) means for prompting the seller to perform a specified sequence of operations in a desired sales communication process during a meeting with the prospect, said operations including recording prospect data;
- e) means for restricting the seller's ability to use the sales support computer if the seller does not perform the specified sequence of operations; and
- 25 f) means for summoning assistance for the seller

- 37 -

42. The sales support computer of claim 41, wherein the particular interest is selected from the group consisting of safety, economy, performance, style, trailing towing capacity, side airbags, and anti-lock braking.

5 43. The sales support computer of claim 41, wherein the information about at least one particular interest of the prospect includes information about the composition of the prospect's family.

44. A sales support computer comprising:

- 10 a) means for locally storing a copy of at least a portion of a sales information data store external to the sales support computer;
- b) means operable by a seller for recording prospect data about a prospect, including information about at least one particular interest of the prospect;
- c) means for querying a credit information data store to get an indication of the
15 prospect's creditworthiness;
- d) means for querying said sales information data store to determine the availability of specific products having one or more features correlated with one or more particular interests of the prospect, including determining whether a communications link exists with the sales information data store, and if so,
20 querying the sales information data store, otherwise querying said locally-stored copy;
- e) means for prompting the seller to perform a specified sequence of operations in a desired sales communication process during a meeting with the prospect, said operations including (1) recording prospect data and (2) telling the prospect about
25 at least one of said one or more features;
- f) means for recording the duration of performance of respective operations in the desired sales communication process;
- g) means for restricting the seller's ability to use the sales support computer if the seller does not perform the specified sequence of operations; and

- 38 -

h) means for summoning assistance for the seller.

45. A sales support computer comprising:

a) means for locally storing a copy of at least a portion of a sales information data store external to the sales support computer;

b) means for periodically updating said locally-stored copy;

c) means operable by a seller for recording prospect data about a prospect, including information about at least one particular interest of the prospect;

d) means for querying a credit information data store to get an indication of the prospect's creditworthiness;

e) means for determining the availability of specific products having one or more features correlated with one or more particular interests of the prospect, including determining whether a communications link exists with the sales information data store, and if so, querying the sales information data store, otherwise querying said locally-stored copy;

f) means for prompting the seller to perform a specified sequence of operations in a desired sales communication process during a meeting with the prospect, said operations including (1) recording prospect data and (2) telling the prospect about at least one of said one or more features;

g) means for recording the duration of performance of respective operations in the desired sales communication process;

h) means for restricting the seller's ability to use the sales support computer if the seller does not perform the specified sequence of operations; and

i) means for summoning assistance for the seller.

46. A sales support computer comprising:

a) a processor;

b) a pen-based user interface;

c) a wireless communications interface;

- 39 -

- d) a data store;
- e) a program store containing programming executable by the processor for carrying out operations including:
 - 1) downloading, via the wireless communications interface into the data store, a copy of at least a portion of a sales information data store external to the sales support computer;
 - 2) receiving, via the pen-based user interface, data inputted by a seller about a prospect, referred to as prospect data, including information about at least one particular interest of the prospect;
 - 3) querying said sales information data store to determine the availability of specific products having one or more features correlated with one or more particular interests of the prospect, including determining whether a communications link exists with the sales information data store, and if so, querying the sales information data store via the wireless communications interface, otherwise querying said locally-stored copy;
 - 4) prompting the seller to perform a specified sequence of operations in a desired sales communication process during a meeting with the prospect; and
 - 5) restricting the seller's ability to use the sales support computer if the seller does not perform the specified sequence of operations.

47. A portable sales support computer comprising:

- a) a processor;
- b) a pen-based user interface;
- c) a wireless communications interface;
- d) a data store;
- e) a program store containing programming executable by the processor for carrying out operations including:

- 40 -

- 1) downloading, via the wireless communications interface into the data store, a copy of at least a portion of a sales information data store external to the sales support computer;
- 2) receiving, via the pen-based user interface, data inputted by a seller about a prospect, referred to as prospect data, including information about at least one particular interest of the prospect;
- 3) querying a credit information data store via the wireless communications interface to get an indication of the prospect's creditworthiness;
- 4) querying said sales information data store to determine the availability of specific products having one or more features correlated with one or more particular interests of the prospect, including determining whether a communications link exists with the sales information data store, and if so, querying the sales information data store via the wireless communications interface, otherwise querying said locally-stored copy;
- 5) prompting the seller to perform a specified sequence of operations in a desired sales communication process during a meeting with the prospect, said operations including (1) inputting prospect data and (2) telling the prospect about at least one of said one or more features;
- 6) recording the duration of performance of respective operations in the desired sales communication process;
- 7) restricting the seller's ability to use the sales support computer if the seller does not perform the specified sequence of operations; and
- 8) in response to a command inputted by the seller, transmitting via the wireless communications interface a signal summoning assistance for the seller
